1 Introduction

You can and should cross-reference sections and sub-sections. We use R Core Team (2023) and Wickham et al. (2019).

The remainder of this paper is structured as follows. Section 2....

2 Data

Some of our data is of penguins ([?@fig-bills](#)), from Horst, Hill, and Gorman (2020).

Talk more about it.

And also planes ([?@fig-planes](#)). (You can change the height and width, but don't worry about doing that until you have finished every other aspect of the paper - Quarto will try to make it look nice and the defaults usually work well once you have enough text.)

Talk way more about it.

3 Model

The goal of our modelling strategy is twofold. Firstly,...

Here we briefly describe the Bayesian analysis model used to investigate... Background details and diagnostics are included in Appendix [B](#).

3.1 Model set-up

Define y_i as the average number of points per game scored by a team through out the NBA season. Then α is the average assists per game, ρ the average rebounds per game, β is blocks per game, ψ is steals per game and lastly, τ is turnovers per game.

$$y_i | \mu_i, \sigma \sim \text{Normal}(\mu_i, \sigma) \quad (1)$$

$$\mu_i = \alpha + \rho_i + \beta_i + \xi_i + \tau_i \quad (2)$$

$$\alpha \sim \text{Normal}(0, 2.5) \quad (3)$$

$$\rho \sim \text{Normal}(0, 2.5) \quad (4)$$

$$\beta \sim \text{Normal}(0, 2.5) \quad (5)$$

$$\psi \sim \text{Normal}(0, 2.5) \quad (6)$$

$$\tau \sim \text{Normal}(0, 2.5) \quad (7)$$

$$\sigma \sim \text{Exponential}(1) \quad (8)$$

$$(9)$$

```
# Simulating data
set.seed(123) # For reproducibility
sim_nba_data <- data.frame(
  Year = rep(1980:2023, times = 10), # Simulate 10 records per year
  Num_teams = c(rep(22, each = 1 * 10),
                 rep(23, each = 8 * 10),
                 rep(25, each = 1 * 10),
                 rep(27, each = 6 * 10),
                 rep(29, each = 9 * 10),
                 rep(30, each = 19 * 10)), # Adjusted each parameter as needed
  PTS = rnorm(440, mean = mean(full_nba_data$PTS), sd = sd(full_nba_data$PTS)),
  AST = rnorm(440, mean = mean(full_nba_data$AST), sd = sd(full_nba_data$AST)),
  TRB = rnorm(440, mean = mean(full_nba_data$TRB), sd = sd(full_nba_data$TRB)),
  STL = rnorm(440, mean = mean(full_nba_data$STL), sd = sd(full_nba_data$STL)),
  BLK = rnorm(440, mean = mean(full_nba_data$BLK), sd = sd(full_nba_data$BLK)),
  TOV = rnorm(440, mean = mean(full_nba_data$TOV), sd = sd(full_nba_data$TOV))
)

# Fit a multiple linear regression model
nba_model <- lm(PTS ~ Year * Num_teams + AST + TRB + STL + BLK + TOV, data = sim_nba_data)
model_ny <- lm(PTS ~ Num_teams + AST + TRB + STL + BLK + TOV, data = sim_nba_data)

# Summary of the linear model
msummary(
  list(
    "With Year" = nba_model,
    "Without Year" = model_ny
  ),
  fmt = 2
)
```

)

We run the model in R (R Core Team 2023) using the `rstanarm` package of Goodrich et al. (2022). We use the default priors from `rstanarm`.

3.1.1 Model justification

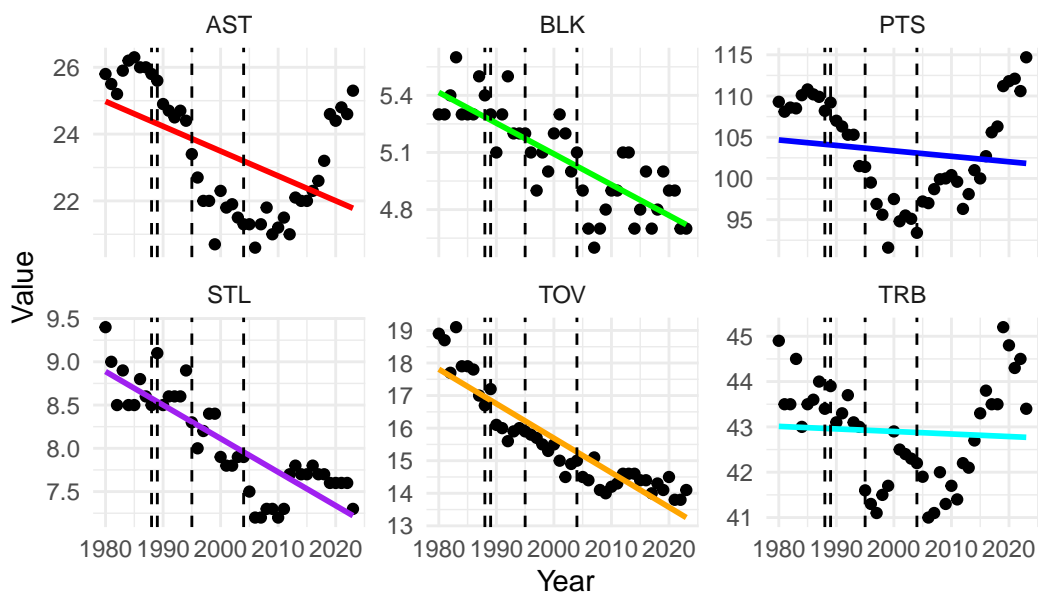

We expect a positive relationship between the size of the wings and time spent aloft. In particular...

We can use maths by including latex between dollar signs, for instance θ .

4 Results

Our results are summarized in `?@tbl-modelresults`.

NBA Stats Over Years

	With Year	Without Year
(Intercept)	−49.34 (535.29)	121.70 (9.67)
Year	0.09 (0.27)	
Num_teams	7.50 (19.16)	−0.03 (0.12)
AST	−0.15 (0.13)	−0.15 (0.13)
TRB	−0.33 (0.17)	−0.33 (0.17)
STL	0.15 (0.32)	0.14 (0.32)
BLK	−0.42 (0.39)	−0.44 (0.38)
TOV	0.07 (0.19)	0.07 (0.19)
Year × Num_teams	0.00 (0.01)	
Num.Obs.	440	440
R2	0.017	0.016
R2 Adj.	−0.001	0.002
AIC	2997.1	2993.8
BIC	3038.0	3026.5
Log.Lik.	−1488.559	−1488.893
RMSE	7.13	7.13

NBA Stats Over Years (Post-2004)

5 Discussion

5.1 First discussion point

If my paper were 10 pages, then should be be at least 2.5 pages. The discussion is a chance to show off what you know and what you learnt from all this.

5.2 Second discussion point

5.3 Third discussion point

5.4 Weaknesses and next steps

Weaknesses and next steps should also be included.

Appendix

A Additional data details

B Model details

B.1 Posterior predictive check

In `?@fig-ppcheckandposteriorvsprior-1` we implement a posterior predictive check. This shows...

In `?@fig-ppcheckandposteriorvsprior-2` we compare the posterior with the prior. This shows...

B.2 Diagnostics

`?@fig-stanareyouokay-1` is a trace plot. It shows... This suggests...

`?@fig-stanareyouokay-2` is a Rhat plot. It shows... This suggests...
